## Green Laser Level

### Description and Benefit

This innovation is used to help set up intersection site distance in a safer way. The old way had us kneeling down on the pavement, requiring us to take our eyes off traffic to dial in our target. To improve this process, we use a Green Laser Level (GLL). This level is very easy to read in the day light and it also allows users to face traffic and stay on their feet, facing traffic when setting up the equipment for measurement.
