

Concrete Culvert Marker

Description and Benefit

This innovation uses 72” fiberglass marker stakes that are bright orange with a 9” highly reflective strip for 360- degree visibility. These are popular for driveway markers, but we found them very useful to mark concrete culverts and other hazardous areas for mowing operations. They are drilled and glued into the concrete walls for stability with a simple 7/16” drill bit and a dash of gorilla glue caulking. The rods are flexible and lightweight for easy transporting and installing.
