

### Track Slide

#### Description and Benefit

The track frame on a skid steer can often come off the rollers. This innovation makes it easier to put the track back on skid steer or mini hoe by having the machine do the heavy work. The track is slid on and then the machine turns the track, so the bars are on the front roller. Then you can take the bar and slide the track back in place. This innovation helps improve our work process and saves straining and other back injuries by not having to lift to get the track back on.
