Easy Mix & GO

Description and Benefit

This innovation is an upgraded version of our concrete trailer. This upgraded setup includes the rock and sand mix in the dump bed. We are also able to carry all other materials and tools necessary to remove and replace the concrete section in need of repair such as a 250-gallon water tank, air compressor and hoses, rock and sand mix, Portland cement, jackhammers, skid steer with new mixer attachment (also part of the upgrade) and all other hand tools and materials needed to make repairs and finish out the concrete.

The biggest savings comes from reducing or possibly eliminating the need of outsourcing concrete trucks that charge additional fees for small loads of concrete that are three yards or less. This set up will also save money by reducing mix time and employees needed for the process. The trailer's setup will save time by eliminating physically shoveling materials into the mixer and by cutting mixing times in half which will allow us to almost double overall production. This will simplify the process by removing the shoveling step and being able to take materials directly to work zones without manhandling, tugging, and pushing on the old-style mixers as well as reducing the number of employees needed that could be working in other areas. The innovation will improve safety by removing the shoveling process we drastically reduce lifting and twisting actions that can cause lower back strains, exhaustion, and overheating.
