Jefferson City, MO 65101

Dear Mr. Davis:

Subject: Environmental Studies  
Route 63, Osage, Maries and Phelps Counties  
Convert Route 63 to a Four-Lane Facility  
Job No. J5P0950  
Farmland Conversion Impact Rating

Enclosed, for the above referenced project, is one Farmland Conversion Impact Rating Form (CPA-106), and a map showing the project location. The project proposes to convert the Route 63 corridor to a four-lane facility from the Route 50/63 interchange north of Westphalia in Osage County to just north of Rolla in Phelps County. Included on the CPA-106 form are four acreage figures. One is for the proposed Alternate A, which is mostly west of Route 63. One is for Alternate B, which is primarily to the east. A third figure is for a series of connectors that may run from these alternates to existing Route 63 or to each other. A fourth figure is for new right of way that may be associated with widening along existing route 63. The project will cause the conversion of the recorded amount of acreage.

Please complete the applicable parts II, IV and V of the enclosed form and return it to me. You may make copies as needed. If you have any questions, please feel free to call me at 573-526-6683. Your assistance is greatly appreciated.

Sincerely,

Kevin McHugh  
Agricultural/Land Use Specialist

TO: Memorandum to File

CC: Roger Schwartze - 5

FROM: Kevin McHugh KM  
Agricultural/Land Use Specialist-de

DATE: October 23, 2007

SUBJECT: Environmental Studies  
Route 63, Osage, Maries and Phelps Counties  
Just South of Route 50 to North of Rolla  
Conversion to a Four Lane Facility  
Job No. J580929 JSP0950  
Farmland Conversion Impact Rating

The project referenced above has been rated for farmland conversion impact. The recorded Part V Relative Value of Farmland to be converted totaled 63.1 points for Alternate A, 129.3 points for Alternate B, 113.2 points for the connecting segments, and 109.4 points for widening along existing right of way. The site assessment rating scored 64 points out of a possible 160 for Alternates A and B, 51 points for the connectors, and 52 points for widening along existing. The total conversion impact rating was 127.1 points for Alternate A, 129.3 points for Alternate B, 113.2 points for the connecting segments, and 109.4 points for those portions of the proposed project that propose to widen along existing right of way. These totals are well below the 160-point threshold established for consideration of farmland protection. The completed form is on file for review.

The following relates to the Part VI Site Assessment Criteria. The alignments are not known to be protected from conversion by any State, local government, or private non-profit policy or program. Impacts to on-farm investments will be minimized to the extent possible. After project completion, any remnants of the remaining land of the affected farms that becomes nonfarmable will be dealt with according to the provisions of the law. All farm support services are available to the area and will not be negatively impacted by the project. The project will be fully compatible with existing agriculture.

Dear Mr. McHugh,

Attached is the completed CPA-106 form per your request for a Farmland Conversion Impact Rating for road improvements along Highway 63 in Osage, Maries, and Phelps Counties. (Job No. J5P0950).

After you complete the form, please return one copy for our records.

Please feel free to contact me if I can be of further assistance.

## LAWS AND REGULATIONS

- On January 9, 2001, the U.S. Supreme Court issued a decision, *Solid Waste Agency of Northern Cook County (SWANCC) v. United States Army Corps of Engineers*. The decision reduces the protection of isolated wetlands under Section 404 of the CWA. Prior to the SWANCC decision, the USACE had adopted a regulatory designation of “waters of the U.S.” that afforded federal protection for almost all of the nation’s wetlands. The Supreme Court also concluded that the use of migratory birds to assert jurisdiction over the site exceeded the authority that Congress had granted the USACE under the CWA. The Court interpreted that USACE jurisdiction is restricted to navigable waters, their tributaries, and wetlands that are adjacent to these navigable waterways and tributaries. The decision leaves “isolated” waters/wetlands unprotected by the CWA.
- As a result of the Supreme Court decision on **Rapanos** (June 2006), the agencies (USACE and EPA) jointly issued guidance on the determination of whether a particular water body is subject to CWA section 404 jurisdiction. The Supreme Court decision requires that, in certain circumstances, a “significant nexus” evaluation be conducted to support jurisdictional and non-jurisdictional determinations. The guidance is consistent with the Supreme Court’s decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* regarding the scope of the agencies’ jurisdiction under the CWA. Specifically, this guidance discusses the agencies’ protection of three classes of waters through the following actions:
  - 1) Continuing to regulate “traditionally navigable waters,” including all rivers and other waters that are large enough to be used by boats that transport commerce and any wetlands adjacent to such waters;
  - 2) Continuing to regulate “non-navigable tributaries that are relatively permanent and wetlands that are physically connected to these tributaries”; and
  - 3) Continuing to regulate based on case-by-case determinations for other tributaries and adjacent wetlands that have certain characteristics that significantly affect traditionally navigable waters.
- **Executive Order 11990 Protection of Wetlands** issued in 1977 requires that federal activities (including federally funded projects) as a whole result in no net loss of wetlands.

## QUANTITATIVE ANALYSIS

For the DEIS and FEIS, estimates of stream impacts were quantified using the measure tool in ArcGIS 9.2 to measure along USGS mapped streams. The length was quantified within the corridor lines for each alternate. Also described along with the length of stream was the type of impact, for instance, *culvert*, *culvert extension*, *bridge*, *channel movement*, or a combination. The drawing below illustrates examples of how the impact lengths were determined (Figure 1). The first example, (a), exhibits how a stream was measured when the headwaters begin within the study corridor. This was described as a *channel movement* because it is assumed the channel will be moved into a MoDOT roadside ditch due to the small amount of drainage within the corridor limits. The second, (b), demonstrates how a stream that runs through the study corridor was measured. This type of stream was described as a *channel movement* because it is assumed

that a culvert will be placed relatively perpendicular to the roadway, thereby reducing the length of stream channel. The same method was used to measure the stream on each side of the existing alignment between corridor lines when the alternative was on existing alignment (c). This type of impact was described as a *culvert extension*. Example (d) demonstrates how a simple stream crossing was measured and assumed that the *culvert* would be at the

same or close to the same skew as the stream. Subsequent field reconnaissance was conducted for the preferred alternate where accessible by landowner permission to confirm mapped resources and identify additional resources (See Technical Report for details).

## TYPES OF WETLANDS

### Palustrine Wetlands

Palustrine wetlands cover less than 20 acres, lack active wave-formed or bedrock shoreline features, and have water depths at low water of less than six feet. Palustrine wetlands are subsequently classified according to dominant vegetation:

- Palustrine unconsolidated bottom (PUB) are characterized by particles smaller than stone and a vegetative cover less than 30 percent. This classification is typically applied to small “pond-like” wetlands.
- Palustrine emergent wetlands (PEM) are characterized by herbaceous (non-woody) plants. Emergent wetlands are also known as marshes, meadows, fens, etc.

- Palustrine scrub-shrub (PSS) wetlands are characterized by woody vegetation that is less than 20 feet tall.
- Palustrine forested wetlands (PFO) are characterized by woody vegetation that is 20 feet tall or taller.

### **Riverine Wetlands**

Riverine wetlands are those contained within stream channels that are not dominated by trees, shrubs, or emergent vegetation. The USFWS riverine classification is typically used to describe perennial or intermittent streams/rivers and active (at least seasonally) side channels. This classification is not typically used in describing wetlands; rather these resources are classified as perennial or intermittent streams.

## **Miscellaneous**

### **How will project impacts to water resources be avoided and/or minimized?**

Impacts to water resources can be avoided and/or minimized through implementing MoDOT's SWPPP, placing rock blanket at culvert outlets to minimize velocities and minimizing the channelization of streams, etc. When the new alignment is collocated with the existing facility, impacts are limited to one locality. Design/construction methods used to minimize impacts include steepening the side slopes of the roadway to limit the footprint, compressing the median width, and adjusting the alignment to minimize overall project impacts. Additionally, impacts to first and second order streams will be minimized by using energy dissipators to reduce downstream velocities.

### **Are there locations in the study corridor where mitigation can occur?**

MoDOT currently owns and maintains the MoDOT Mari-Osa Delta Region Mitigation Bank, a wetland and stream mitigation bank. It is located within the Osage/Ozark Ecological Drainage Unit (EDU). This drainage unit serves as the service area for the Bank. The drainage unit is composed of smaller basins, and the Lower Osage River Basin is a component of it. Impacts within the Route 63 corridor (within the same drainage unit/service area) can be debited from the Bank at a ratio of 1:1. Impacts outside the drainage unit (for instance, within the Gasconade or Bourbeuse River drainage units) will have an increased ratio in order to debit from the Bank. The ratio for outside the watershed is typically 2:1. Approximately half of the corridor falls within the service area for the Bank (Figure 2).
