Realty Assets Planner

Description and Benefit

The Realty Assets Planner innovation includes the Utilization of Microsoft Teams Planner to coordinate Realty Asset Management in district right-of-way. Land related transactions tend to have multiple steps that rely on interdepartmental cooperation and allows for better coordination. Each task details logical steps via a checklist to refresh the user on what is required for leases, excess land, and Road Relinquishments. The use of Agile tools over traditional Project Management tools provides flexibility, most notably Kanban Boards, which allow moving items into different phases as needed. The Kansas City District performs Realty Assets duties from the beginning to the end and other districts may distribute them. The Planner allows the user to cross-functionally assign work while still allowing group collaboration. Microsoft Teams Planner is an excellent tool for Kanban Boards, Color Tagging and Task Checklists that aid in an organized methodology for training new hires in a complex process that would normally take several years to gain knowledge.
