Bolt-On Rubber Track Grouser

Description and Benefit

The Bolt-On Rubber Track Grouser innovation was developed to improve traction for skid steers equipped with mulching heads, which often struggle in wet, muddy, snowy, or uneven terrain. Rubber tracks alone provide limited grip, causing machines to get stuck or slide on banks, wet grass, and brush. These custom cleats significantly enhance traction, making it easier to maneuver in challenging conditions and reducing downtime. In addition to improving mobility, the cleats help protect rubber tracks from damage caused by spinning and slipping, extending track life and preventing costly repairs. This simple yet effective solution increases operational efficiency, safety, and equipment longevity, delivering consistent performance across diverse environments.
