

Control Screen Riser

Description and Benefit

This innovation is a riser for retrofitted trucks that raises the V-BED control screen above control knobs ensuring clear visibility and easier access to the screen. This simple, durable solution improves functionality, safety and efficiency by allowing operators to focus on the task at hand. Operators can now easily see and adjust settings without unnecessary movement or distractions. Its ergonomic placement reduces strain, enables faster and more efficient control adjustments during operation. Operators no longer need to shift their focus or adjust their position to view the screen which reduces the risk of accidents.
