Distributor Hose Transport Lock

Description and Benefit

The Distributor Hose Transport Lock Innovation is a secure, long-lasting solution for holding and locking distributor load/unload hoses in place, preventing them from dragging during vehicle movement. Featuring a pressure-relief valve and snap-on/off attachments, it eliminates the need for temporary tie-downs like bungee cords or ropes, which often fail due to wear and weather. Built for durability, this system can be installed once and lasts the life of the truck, reducing maintenance and replacement costs. By preventing hose damage and oil residue or runoff on roadways, it enhances safety and ensures cleaner work environments. This innovation saves time, simplifies operations, and improves efficiency while delivering a reliable, cost-effective alternative to traditional methods.
