Edge Rutt Filler

Description and Benefit

The Edge Rutt Filler is a one-person solution for efficiently leveling rocks during edge rutting operations. Mounted to the truck bed chute, it evenly distributes material to prevent clumps and create a smooth surface. Equipped with a solar-powered 4K HD camera, operators can monitor the edge in real time for precision, adjusting speed as needed without relying solely on mirrors. Built from durable steel bars and repurposed components, the Edge Rutt Filler improves accuracy, reduces labor, and enhances safety by streamlining the edge rutting process.
