Hand Striper 2.0

Description and Benefit

The Hand Striper 2.0 innovation is a custom-built solution designed to efficiently mark stripes on patched roads without relying on temporary tabs that often fail. This system incorporates a footage counter for precise measurements and applies reflective beads at the correct thickness and width, ensuring compliance and visibility. By enabling accurate striping while the road is already closed for work, it improves safety and eliminates the need for additional traffic control measures. The design streamlines operations, saves time, and enhances efficiency by allowing crews to quickly measure and stripe patches with consistent quality. This innovation delivers a safer, faster, and more reliable approach to temporary roadway marking.
