Permit Mapping

Description and Benefit

Permit Mapping is a cloud-based solution that uses Google Maps to plot active and potential permit locations in a shared view accessible from both desktop and mobile devices. By signing into a designated shared account, users can drop pins with key details such as permit numbers and contact information, which are instantly available for hands-free navigation in the field. This system centralizes permit data, allowing multiple users to update information in real time, improving coordination and reducing response time when issues arise in work zones. It eliminates manual searches and paperwork, simplifies tracking, and ensures accurate, current information is readily available without additional labor or cost. Overall, Permit Mapping enhances efficiency, accuracy, and communication by providing a single, user-friendly platform for managing permits across office and field environments.
