

Retro Tek

Description and Benefit

The Retro Tek mobile reflectometer is an innovation that measures road striping reflectivity at highway speeds, eliminating the need for manual checks and work zones. Mounted on the front of a truck, it captures data for multiple lines, turn arrows, and stop bars while traffic flows normally, greatly improving safety by keeping workers out of the roadway. The system records reflectivity data, which can be reviewed through video, Excel spreadsheets, and PDF reports to identify pass/fail segments. This solution saves time by reducing inspection duration, saves money by preventing unnecessary restriping, and simplifies operations by automating data collection and analysis—all without disrupting traffic or exposing crews to hazards.
